

Security Services

“ It’s fair to say the main security risk these days is posed by the Internet itself. Designed in the 1960’s to be a physically robust but insecure communication medium between parties who knew and trusted one another, the Internet has gradually become a general purpose highway for data exchange in which all comers take their chances...”

A P Systems can advise clients of any security vulnerabilities, threats and risks that may exist in the IT environment. **A P Systems** can then provide solutions in order to address these issues.

Areas that often require attention include:

- Firewall Configuration
- Secure E-mail
- Virus Protection
- Password Policies
- Secure Remote Access
- Network Access Points

The ever-increasing amount of Internet and E-mail activity within organisations is ensuring that security should be a top priority for modern businesses; however, Security issues are often overlooked when assessing priorities within the company. With the potential loss of productivity and information at risk by a virus strike or a hacker attack, time taken to consider a pre-emptive strategy to protect your valuable data and computer systems can prove to be very cost effective.
